Front-End Development

#3 Learn Once, Write Anywhere

API

- API (Application Programming Interface) is a software intermediary which allows applications to talk to each other.
- When you use an application on your mobile phone, the application connects to the Internet and sends data to a server. The server then retrieves that data, interprets it, performs the necessary actions and sends it back to your phone. The application then interprets that data and presents to you with the information that you wanted, in a readable way. This is what an API is all of this happens via API.

API

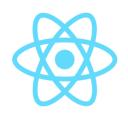

HTTP Methods

- HTTP (The Hypertext Transfer Protocol) is designed to enable communications between clients & servers. It works as a request & response protocol between a client & server.
- A web browser may be the client, and an application on a computer that hosts a web site may be the server.
- The most commonly used HTTP Methods are POST, GET, PUT, PATCH & DELETE.

RESTful APIs

- RESTful (Representational State Transfer)
 web services is a way of providing
 interoperability between computer
 system on the internet.
- A RESTful API is an application program interface that uses HTTP requests to GET, PUT, POST or UPDATE data, based on representational state transfer (RESTful) architecture technology.

JSON

■ JSON (Javascript Object Notation)
is a lightweight data-interchange format that based on a subset of JS. It's easy to read, write and can be used with any modern language.
JSON is not a JavaScript Object!

JSON rules:

- Uses property/value pairs = {"nama": "Andi"}
- Uses dblquote on its prop & val (ex number)
- Must use specified data type
- File type is ".json"
- Mime type is "application/json"

Validate JSON jsonlint.com

```
1 * {
        "nama": "Andi",
                                                 nama: "Andi",
                                                 usia: 24,
        "usia": 24,
                                                 job: "PNS"
        "job": "PNS"
5
                                           Validate JSON
                                                            Clear
 Validate JSON
                   Clear
                                         Results
Results
                                          Error: Parse error on line 1:
                                              nama: "Andi", usia:
 Valid JSON
                                          Expecting 'STRING', '}', got 'undefined'
```

Object → JSON

```
var orang = {
  nama: "Andi",
  usia: 21,
  asal: "Lampung"
orang = JSON.stringify(orang);
console.log(orang);
console.log(orang.nama);
```

JSON → Object

```
var orang = {
  nama: "Andi",
  usia: 21,
  asal: "Lampung"
orang = JSON.stringify(orang);
orang = JSON.parse(orang);
console.log(orang);
console.log(orang.nama);
```

- A powerful GUI platform to make API development faster & easier, from building API requests through testing, documentation & sharing.
- Postman has features for every API developer: request building, tests & pre-request scripts, variables, environments & request descriptions, designed to work seamlessly together.
- Download from getpostman.com

GET all data from https://facebook.github.io/react-native/movies.json

```
← → C 🗎 Secure https://facebook.github.io/react-native/movies.json
  "title": "The Basics - Networking",
  "description": "Your app fetched this from a remote endpoint!",
  "movies": [
    { "title": "Star Wars", "releaseYear": "1977"},
    { "title": "Back to the Future", "releaseYear": "1985"},
    { "title": "The Matrix", "releaseYear": "1999"},
    { "title": "Inception", "releaseYear": "2010"},
    { "title": "Interstellar", "releaseYear": "2014"}
```

Using Axios Package

Axios is an NPM built-in package that allows us to:

- Make http requests from node.js
- Supports the Promise API
- Intercept request and response
- Transform request and response data
- Cancel requests
- Automatic transforms for JSON data

Install Axios package:

\$ npm install axios --save

```
import React, { Component } from 'react';
import axios from 'axios';
                                                Axios
class App extends Component {
                                       #1 Get All Data
  componentDidMount(){
    axios.get('https://facebook.github.io/react-native/movies.json')
    .then((ambilData) => {
    console.log(ambilData);
  render() {
    return (
      <div>
        <h1>Coba Get Data</h1>
      </div>
export default App;
```
